CANopen I/O Module

4 Configurable Analogue Inputs

mod. IO-CB/AI-04RT

4 inputs configurable for:

TC, RTD or mV

APPLICABLE STANDARDS

The AI-04RT module is suited for the CiA DS301 protocol [1] and implements the CiA DS 401 standard Device Profile, as far as the Analogue Input Function Block is concerned [2].

Characteristics

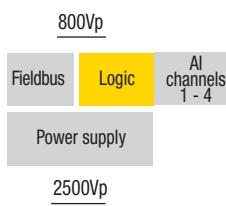

Technical data

Accuracy at 25°C	±0.05% FS
Temperature coefficient	0.005% FS/K
Input impedance	mV > 100kΩ
Digital resolution	16 bit
Data format	Binary Integer
Input range	±50 mV, ±300 mV, ±1000 mV
Type of sensor TC	J, K, L, N, R, S, T
Type of sensor RTD	2 – 3 - wire Pt100, Pt1000
Conversion Time TC, mV	100 ms
Conversion Time RTD	120 ms
Oversupply protection	30 V
CMRR	> 100 dB

General

3 way isolation	800 Vp
Power supply	24 Vdc; -15...+25%
Power consumption	3 W
Dimensions	L: 76; H: 110; W: 65
Weight	220 g
Safety regulations	Isolation class II (50 Vrms)
EN61010-1	Installation category II
CE marking	Pollution degree 2
	EN61131-2

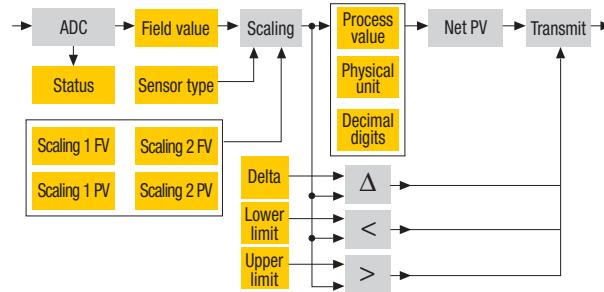

3 way isolation diagram

Environment

	Operating	Storage
Temperature	-10...+65°C	-40...+85°C
Relative Humidity	5...95% non condensing Appropriate measures must be taken against humidity >85%	5...95% non condensing For a short period, slight condensation may appear on the housing
Mounting	Vertical, free air	
Protection	IP20	
Vibrations (3 axes)	10...55Hz 0.0375mm 57...150Hz 0.5g	
Shock (3 axes)	15g, 11ms half sine	

Functional Block Diagram

The analogue input function block describes, for each input channel, how field values are converted to process values. The field values are converted to the real physical dimension of the measured quantity, and the result is called "Process Value". The conversion from Field Value to Process Value is generally described as a linear transformation.

This is defined by two pairs of field values and corresponding process values (Input Scaling 1 FV/Input Scaling 1 PV and Input Scaling 2 FV/Input Scaling 2 PV), called calibration point 1 and 2.

Non-linear transformation (e.g. for thermocouples and PT100 sensors) is possible, and is defined within the parameter "Sensor Type". In this case the input scaling values are meaningless.

The calibration characteristic can be shifted by an additional "input offset" value.

Writing "1" on autozero will enable the zero offset value to be set so that the instantaneous measured "process value" becomes zero. The tare-zero value works like the zero offset value, but results in an additional "net process value". Writing "1" on autotare will enable the tare zero value to be set so that the instantaneous measured "net process value" becomes zero. The parameters "Span Start" and "Span End" define the process value validity range. If the process value exceeds these limits it will be marked as "overloaded".

PDOs used by the module

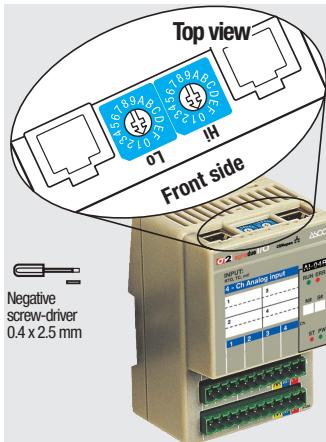

TPDO	Properties	Mapped objects	Index	Sub-index
TPDO 1	COBID: 180h + NodeID Transmission Type: 01h *	NetPV1 AI Operating mode1	9140h	01h
TPDO 2	COBID: 280h + NodeID Transmission Type: 01h *	NetPV2 AI Operating mode2	9140h	02h
TPDO 3	COBID: 380h + NodeID Transmission Type: 01h *	NetPV3 AI Operating mode3	9140h	03h
TPDO 4	COBID: 480h + NodeID Transmission Type: 01h *	NetPV4 AI Operating mode4	9140h	04h

Note: * The Transmission Type is configurable:

01h is the factory set (value present in the modules when come from the factory);
FFh is the default value.

Hardware Set-up

Hexadecimal rotary switches, service and I/O LEDs

LED	Status	Meaning
RUN	ON	Operational
	Blinking	Pre-operational (CANopen)
	Single flash	STOPPED
	OFF	Device in RESET state
ERR	ON	BUS OFF
	Single flash	Warning limit reached
	Double flash	Error Control Event
	Triple flash	Sync Error (CANopen)
ST	OFF	No error. Device working
	ON	DIAG Error
	Blinking	INIT and DIAG running
	Single flash	Baud rate setting
PWR	OFF	Module OK and ready
	ON	Module Power Supply ON
PWR	OFF	Module Power Supply OFF

Value	Sensor type	Decimal digits	Value	Sensor type	Decimal digits
TCJ	0x01	2	PT100 3 wires *	0x1E	2
TCK	0x02	2	PT1000 2 wires	0x21	2
TCL	0x03	2	PT100 2 wires	0x24	2
TCN	0x04	2	±1 V	0x2B	3
TCR	0x05	2	±50 mV	0x2710	3
TCS	0x06	2	±300 mV	0x2711	3
TCT	0x07	2			

(Sub-Index 1 → channel 1, Sub-Index 2 → channel 2, Sub-Index 3 → channel 3, Sub-Index 4 → channel 4).

*] Default value

Bit Rate and Node ID configuration

Bit rate

Lo switch	Baud rate kbps	Bus length m
1	20	2500
2	50	1000
3	100	500
4	125	500
5	250	250
6 *	500	100
7	800	50
8	1000	25

Node ID

Hi switch	Lo switch	Valid ID Node
0	1	01h (address 1)
0	2	02h (address 2)
↓	↓	↓
7	F *	7Fh (address 127D)

Notes: * Default value

Procedure for Node ID and Bit Rate configuration

The HI and LO hexadecimal rotary switches set the module's Bit Rate and CAN Node ID. During the configuration, the module must be **off line** and the CAN bus must be physically disconnected.

To configure the module, follow the procedure:

- 1 Turn the Power OFF
- 2 Set the **HI** switch to "F"
- 3 Select the desired Bit Rate value by setting the **LO** switch following the table (e.g. "8" for 1 Mbps)
- 4 Turn the Power ON
- 5 Shift the **HI** switch to "E" (all the module service LEDs should flash)
- 6 Turn the Power OFF. Now configure Node ID
- 7 Set the **HI** and **LO** switches to the desired valid Node ID following the table
- 8 Turn the Power ON.

Alternatively, at step 7 set the value 00h. Then, at the next Power ON, the last valid stored value will be resumed as Node ID.

Default values: Bit Rate = 500 kbps, Node ID = 127D

Parameter configuration

Index 6110h - AI Sensor type

Index 6131h - AI Physical Unit PV

Index 6132h - AI Decimal Digits PV

The AI Physical Unit PV assigns SI units and prefixes to the process value, with the following structure:

31	24 23	16 15	8 7	0
MSB	Prefix	SI Numerator	SI Denominator	Reserved LSB

Physical units and prefixes are coded according to CiA standard [3]. Within the DS404 profile, some additional physical units are specified:

Code	Physical unit	Code	Physical unit
55h	m/s	A3h	mmHg
56h	Nm	A4h	atm
A1h	at	ABh	PSI
A2h	mmH ² O	ACh	°F

Module specific parameters

Index 2000h – Cold Junction Measure

Temperature of the cold junction, measured on the module's terminal block. Available through TPD04.

Index 3000h – Node Address

Current Module Node ID - Read only access

Index 3001h – Baudrate

Current Module Bit rate - Read only access

Scaling input variables

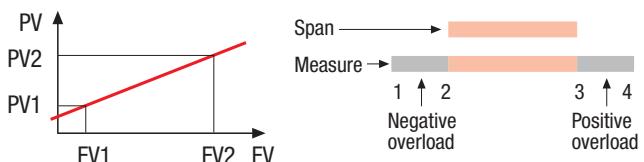

Index 9120h – AI Input Scaling 1FV

Index 9121h – AI Input Scaling 1PV

Index 9122h – AI Input Scaling 2FV

Index 9123h – AI Input Scaling 2PV

As regards linear inputs, the above variables allow the scale of the physical input to be changed and the desired physical unit to be assigned to this input. In addition, an offset can be added.

Index 9148h – AI Span start

Index 9149h – AI Span end

These two variables take into account the validity of the span values, indicating possible overloads and limiting the measure in correspondence of the extreme points of the span.

Span programmed values (°C)

Input	Span Start	Span End	Input	LO Range	HI Range	Span Start	Span End
TCJ	-210°C	1200°C	PT100	-	-	-200°C	600°C
TCK	-200°C	1372°C	PT1000	-	-	-200°C	600°C
TCL	-200°C	600°C	±1 V	-1.28 V	1.28 V	-1 V	+1 V
TCN	0°C	1300°C	±50 mV	-80 mV	80 mV	-50 mV	+50 mV
TCR	0°C	1600°C	±300 mV	-320 mV	320 mV	-700	+300
TCS	0°C	1760°C					
TCT	-200°C	400°C					

Index 6150h – AI Status

bit 7 – 3	2	1	0
Reserved	Negative overload	Positive overload	Not valid (e.g. sensor break)

Index 6F20h – Life Counter

A counter that increments at each new generated sample.

Index 9143h – AI Interrupt Delta NetPV

Index 9144h – AI Interrupt Lower Limit Net PV

Index 9145h – AI Interrupt Upper Limit Net PV

The last three variables relate to the asynchronous mode of transmission of a PDO (transmission type 255). A comparison is made with the mapped Net PV value and a transmission is initiated asynchronously when any of the limits is reached.

Parameter Store/Restore

This module allows parameters to be saved in a non volatile memory. In order to avoid storing parameters by mistake, storage is only executed when a specific signature is written to the appropriate subindex. The signature is “save”.

Similarly, the default values of parameters, according to the communication or device profile, are restored. On receipt of the correct signature in the appropriate subindex, the device restores the default parameters and then confirms the SDO transmission. The signature is “load”.

The new configuration becomes active after a reset, i.e. after a “Power Down” or an NMT “Reset Node” message.

Byte	0	1	2	3	4	5	6	7
Store	22h	10h	10h	01h	73h	61h	76h	65h
Parameter				s	a	v		e
COB – ID = 600h + NodeID								
Restore	22h	11h	10h	01h	6Ch	6Fh	61h	64h
Parameter				i	o	a		d
COB – ID = 600h + NodeID								

Commands

Index 6112h – AI Operating Mode

Determines the operating state of the four input channels according to the following values:

00h	Initialising
01h	Operating (default)

SDO Messages

The entries of a device Object Dictionary are accessed through SDO (Service Data Object) messages. The basic SDO messages are as follows, as based on the Client – Server request and response model:

Byte	0	1	2	3	4	5	6	7
Read request	40h	Index	Sub-Index		Reserved			
				COB – ID = 600h + NodeID				
Read response	4xh *	Index	Sub-Index		Data			
				COB – ID = 580h + NodeID				
Write request	22h	Index	Sub-Index		Data			
				COB – ID = 600h + NodeID				
Write response	60h	Index	Sub-Index		Reserved			
				COB – ID = 580h + NodeID				

* This code is type dependant.

Please refer to the CiA DS301 Profile for more details.

Emergency messages

The module automatically sends emergency messages including error codes. The communication errors are described in CiA DS301 [1].

The error codes are expressed as a DEVICE SPECIFIC ERROR type of code, one for each channel: 0xFF0n for channel n. The codes indicating a specific condition are also inserted, following the table below:

Error code	Error																								
0000000000	No error – This code is generated when exiting an error condition, to notify the end of one of the error states																								
0000000001	Error No Valid Calib – An attempt to change the state of an input channel not properly calibrated to “operating”																								
0000000002	Error No Config – An attempt to change the state of an input channel with a non valid Sensor Type to “operating”																								
0000000006	Error No Command – Invalid command received																								
0000000007	Error Wrong Command – An attempt to execute a command from an illegal state																								
0000000008	Error Wrong Assignment – An attempt to assign a parameter from an illegal state																								
Emergency message	<table border="1"> <tr> <td>0</td> <td>1</td> <td>2</td> <td>3</td> <td>4</td> <td>5</td> <td>6</td> <td>7</td> </tr> <tr> <td>Onh</td> <td>FFh</td> <td>21h</td> <td>00h</td> <td>00h</td> <td>00h</td> <td>0Eh</td> <td>00h</td> </tr> <tr> <td colspan="8" style="text-align: center;">COB – ID = [entry 1014h] + NodeID</td></tr> </table> <p style="text-align: center;"><u>Error code</u></p>	0	1	2	3	4	5	6	7	Onh	FFh	21h	00h	00h	00h	0Eh	00h	COB – ID = [entry 1014h] + NodeID							
0	1	2	3	4	5	6	7																		
Onh	FFh	21h	00h	00h	00h	0Eh	00h																		
COB – ID = [entry 1014h] + NodeID

CAN termination Adapter	AP-S2/TERM-CAN

Warranty: 3 years excluding defects due to improper use

Object Dictionary structure (with default values)

⚠ In order to configure the module, it is necessary to connect it to a PC with the CAN interface and the supervisory software installed. The configuration can be obtained by writing the desired values to the module's variables listed in the Object Dictionary.
