APPLICABLE STANDARDS

The DM-16TS module is suited for the CiA DS301 protocol [1] and implements the CiA DS401 standard Device Profile [2].

Characteristics

Te	chnical data
Number of channels	16
Polarity (EN 61131-2 type 2)	Sink (PNP)
UL (state 0)	-3+11/5 Vdc
UT (transition)	511 Vdc
UH (state 1)	11 30 Vdc
Input impedance	$5\mathrm{k}\Omega$
ON/OFF delay	5 ms
Max. monostable time	65 s

	General	
3 way isolation	Channel to Channel	No
	Channel to Logic	800 Vp
	Logic to Serial Bus 800 Vp	
	Power Supply to Logic 800	Vp
Power supply	24 Vdc; -15+25%	
Power consuption	3 W	
Overvoltage protection	40 Vdc	
Dimensions	L: 76; H: 110; W: 65	
Weight	220 g	
Safety regulations	Isolation class II (50Vrms),	
EN61010-1	Installation cathegory II,	
	Pollution degree 2	
CE marking	EN61131-2	

3 way isolation diagram

800Vp

	Environment					
	Operating	Storage				
Temperature	-10+65°C	-40+85°C				
Relative	595% non condensing	595% non condensing				
Humidity	Appropriate measures must	For a short period, slight				
	be taken against humidity	condensation may appear				
	>85%	on the housing				
Mounting	Vertical, free air					
Protection	IP20					
Vibrations	1057Hz 0.0375mm					
(3 axes)	57150Hz 0.5g					
Shock (3 axes)	15g, 11ms half sine					

CANopen I/O module 16 Digital Channels 8 Inputs + 8 Outputs mod. IO-CB/DM-16TS

8 optoisolated digital inputs whith special functions:

 edge detect and interrupt and 8 optoisolated digital outputs.

\triangle 1

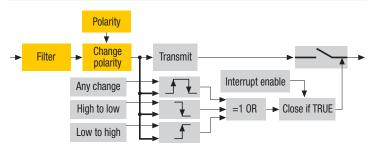

WARNING

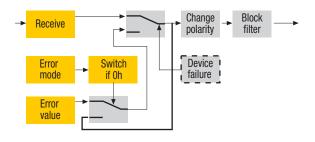

- The product described in this manual should only be installed, operated and maintained by qualified application programmers and software engineers who are familiar with automation safety concepts and applicable national standards.
 This product supports the Parameter defaults indicated by CiA standards, in addition, some para-
- 2) This product supports the Parameter defaults indicated by CiA standards, in addition, some parameters have a factory set (value present in the module when comes from the factory). The default values can be loaded with the restore command, but after the restore, factory set values are lost.

Functional Block Diagram

For each input

For each output

PDOs used by the module

TPDO used by the input channels of the module:

	,			
TPD0	Properties	Mapped objects	Index	Sub-index
TPDO 1	COBID: 180h+ NodelD	DigInput8_1	6000h	01h
IFD0 I	Transmission Type: 01h *			

Note: * The Transmission Type is configurable:

01h is the factory set (value present in the modules when come from the factory); **FFh** is the default value.

RPDO used by the input channels of the module:

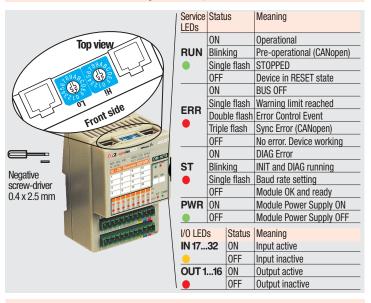

RPD0	Properties	Mapped objects	Index	Sub-index
דוווטו	COBID: 200h + NodeID Transmission Type: 01h *	DigOutput8_1	6200h	01h

Note: * The Transmission Type is configurable:

01h is the factory set (value present in the modules when come from the factory); **FFh** is the default value.

Hardware Set-up

Hexadecimal rotary switches, service and I/O LEDs

Bit Rate and Node ID configuration

Bit rate

Lo switch	Baud rate	Bus length
LO OWITOIT	kbps	m
1	20	2500
2	50	1000
3	100	500
4	125	500
5	250	250
6 *	500	100
7	800	50
8	1000	25

Node ID

Hi switch	Lo switch	Valid ID Node
0	1	01h (address 1)
0	2	02h (address 2)
$\overline{\Psi}$	$\overline{\mathbf{v}}$	\downarrow
7	F	7Fh (address 127D) *

Notes: * Default value

Procedure for Node ID and Bit Rate configuration

The HI and LO hexadecimal rotary swithches set the module's Bit Rate and CAN Node ID. During the configuration, the module must be **off line** and the CAN bus must be physically disconnected.

To configure the module, follow the procedure:

- 1 Turn the Power OFF
- 2 Set the HI switch to "F'
- 3 Select the desired Bit Rate value by setting the LO switch following the table (e.g. "8" for 1 Mbps)
- 4 Turn the Power ON
- 5 Shift the **HI** switch to "E" (all the module service LEDs should flash)
- 6 Turn the Power OFF. Now configure Node ID
- 7 Set the HI and LO switches to the desired valid Node ID following the table
- 8 Turn the Power ON.

Alternatively, at step 7 set the value 00h. Then, at the next Power ON, the last valid stored value will be resumed as Node ID.

Default values: Bit Rate = 500 kbps. Node ID = 127D

Parameter configuration

Configuring the Input Channels

The functional block diagram for the Inputs is consistent with the standard profile CiA DS401 [2].

The digital signal is first filtered (Index 6003h – Filter Constant Input 8-bit and Index 2004 - Filter Constant), then polarised (Index 6002 – Polarity Input 8-bit) and finally assigned to the variable that contains its value (Index 6000h – Read Input 8-bit). The information is now ready to be transmitted on the CAN network via the TPD01. Other entries determine the trigger condition:

Index 6006h - Interrupt Mask Any Change 8-bit: detection of any input level change.

Index 6007h - Interrupt Mask Low-to-High 8-bit: detection of a Low-to-High edge.

Index 6008h - Interrupt Mask High-to-Low 8-bit: detection of a High-to-Low edge.

Index 6005h — Global Interrupt Enable: the actual PDO transmission is performed if two initial conditions are met: the variable in Index 6005h should be "TRUE" and the PDO transmission type should be 255.

Configuring the Output Channels

The Output functional block diagram is consistent with the standard profile CiA DS401 [2].

• Index 6200h - Write Output 8-bit

This object writes a group of 8 outputs:

1 = output active

1 = output not active.

The output signalling from a CAN message is processed first.

Two preprocess items are performed:

• Polarisation Index 6202h - Polarity Output 8-bit

This object defines the polarity of a group of 8 output lines. Output polarity can be inverted individually:

1 = output inverted,

0 = output not inverted.

If the object is not supported, the device behaves according to the default value.

Masking Index 6208h – Filter Mask Output 8-bit

This object defines an additional output filter mask configurable for a group of 8 outputs.

1 = output is set to the received output value

0 = do not care, the received output value is neglected for the corresponding output channel and the old output value is kept.

If the object is not supported, the device behaves according to the default value.

Error mode

In error mode, the outputs behave according to the following two entries:

Index 6206h – Error Mode Output 8-bit:

This object indicates, whether an output is set to a pre-defined error value (see 6207h object) in the event of an internal device failure or of a 'Stop Remote Node' status

1 = output value takes the pre-defined condition specified in object 6207h;

0 = output value is kept if an error occurs.

Index 6207h - Error Value Output 8-bit:

On condition that the corresponding Error Mode is active, device failures set the outputs to the value configured by this object.

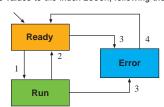

0 = Output is set to '0' in case of fault, if object 6206h is enabled;

1 =Output is set to '1' in case of fault, if object 6206h is enabled.

Commands

Index 200Ch - Operating mode

The device has its own internal state machine. It is possible to move through this by sending appropriate values to the Index 200Ch, following the table below.

Transition	Operating mode value	Behaviour
Init	-	At Power-Up, the Device is in the "ready" state.
		Transition 1 is also executed if Index 200Ch.
		Operating Mode contains the default value 1
1	01h	Operating mode "RUN" is activated
2	00h	Return to the initialisation "ready" state.
		The transition is performed:
		following an operator's command
		 after assigning a configuration parameter (2004h)
	FFh	The "error" state is automatically assigned by the devi-
3		ce (and the operating mode value is read only) when:
		an attempt is made to execute an unexpected command
	00h	This value causes an exit from the "error" state, after
4		the error condition is acknowledged. The only transition
		is to the "ready" state

Parameter Store/Restore

This module allows parameters to be saved in a non volatile memory. In order to avoid storing parameters by mistake, storage is only executed when a specific signature is written to the appropriate subindex. The signature is "save".

Similarly, the default values of parameters, according to the communication or device profile, are restored. On receipt of the correct signature in the appropriate subindex, the device restores the default parameters and then confirms the SDO transmission. The signature is "load".

The new configuration becomes active after a reset, i.e. after a "Power OFF/Power ON cycle" or an NMT "Reset Node" message.

Byte	0	1	2	3	4	5	6	7		
Store	22h	10h	10h	01h	73h	61h	76h	65h		
Parameter					S	a	٧	е		
		COB - ID = 600h + NodelD								
Restore	22h	11h	10h	01h	6Ch	6Fh	61h	64h		
Parameter					- 1	0	a	d		
		COB -	ID = 600	h + Node	eID					

Emergency messages

The module automatically sends emergency messages including error codes. The communication errors are descrided in CiA DS301 [1]. The error codes are expressed as a DEVICE SPECIFIC ERROR type of code. The codes indicating a specific condition are also inserted, following the table below:

		•						
Error code	Error							
0000000000							error co	ntidion,
	to no	tify the e	nd of one	e of the er	ror states	3		
000000007	Error	Wrong C	ommand	- An atten	npt to exec	cute a con	nmand fro	m an
		state						
	,oga	· Otato						
_	0	1	2	3	4	5	6	7
Emergency	01h	FFh	21h	00h	00h	00h	00h	0yh
Message		COI	B - ID =	[entry 10	14h] + No	odelD		

Error code

SDO Messages

The entries of a device Object Dictionary are accessed trough SD0 (Service Data Object) messages. The basic SD0 messages are as follows, as based on the Client – Server request and response model:

Byte	0	1	2	3	4	5	6	7	
Read	40h	Inc	dex	Sub-Index		Rese	rved		
request			COE	S - ID = 60	00h + N	odelD			
Read	4xh *	Inc	lex	Sub-Index		Da	ta		
response		COB - ID = 580h + NodelD							
Write	22h	Inc	dex	Sub-Index		Da	ta		
request			COE	B - ID = 60	00h + N	odelD			
Write	60h	Inc	lex	Sub-Index		Rese	rved		
response			COE	3 - ID = 58	80h + N	odelD			

* This code is type dependant.

Please refer to the CIA DS301 Profile for more details.

Object Dictionary (with default values)

In order to configure the module, it is necessary to connect it to a PC with the CAN interface and the superivisory software installed. The configuration can be obtained by writing the desired values to the module's variables listed in the Object Dictionary.

Object Dictionary structure
